

### **Bonneville Cutthroat Trout**

Bonneville cutthroat trout is one of three native cutthroats in Utah (the others being the Colorado River and the Yellowstone). It is Utah's state fish, but is considered a sensitive species, existing only in limited numbers. They are found in small, swift-running, cold streams. Able to live in only the very cleanest of waters, protecting their habitat from degradation is important to their survival. Cross-breeding and competition with non-native species of trout is one of their greatest threats. During the summer, cutthroat trout like to eat stoneflies, mayflies and caddisflies.
